

使用 VBox 安装 Oracle Database 12c Flex Cluster for OEL 5.8

第 3 部分 准备网络环境 (磁盘和 yum 源)

本系列为 [Lunar\(\[www.lunar2013.com\]\(http://www.lunar2013.com\)\)](http://www.lunar2013.com) 原创，一共 5 篇，分别为：

[第 1 部分 环境介绍](#)

[第 2 部分 前期准备工作](#)

[第 3 部分 准备网络环境](#)

[第 4 部分 开始安装](#)

[第 5 部分 总结](#)

先看下官方文档，以下是相关需求：

Check	Task
	<p>Public Network Hardware:</p> <ul style="list-style-type: none">• Public network switch (redundant switches recommended) connected to a public gateway and to the public interface ports for each cluster member node.• Ethernet interface card (redundant network cards recommended, bonded as one Ethernet port name).• The switches and network interfaces must be at least 1 GbE.• The network protocol is TCP/IP.
	<p>Private Network Hardware for the Interconnect</p> <ul style="list-style-type: none">• Private dedicated network switches (redundant switches recommended), connected to the private interface ports for each cluster member node. NOTE: If you have more than one private network interface card for each server, then Oracle Clusterware automatically associates these interfaces for the private network using Grid Interprocess Communication (GIPC) and Grid Infrastructure Redundant Interconnect, also known as Cluster High Availability IP (HAIP).• The switches and network interface adapters must be at least 1 GbE.• The interconnect must support the user datagram protocol (UDP).
	<p>Oracle Flex ASM Network Hardware</p> <p>Oracle Flex ASM can use either the same private networks as Oracle Clusterware, or use its own dedicated private networks. Each network can be classified PUBLIC or PRIVATE+ASM</p>

Check	Task
	<p>or PRIVATE or ASM. ASM networks use the TCP protocol.</p>
	<p>Cluster Names and Addresses: Determine and Configure the following names and addresses for the cluster</p> <ul style="list-style-type: none"> • Cluster name: Decide a name for the cluster, and be prepared to enter it during installation. The cluster name should have the following characteristics: Globally unique throughout your host domain. At least one character long and less than or equal to 15 characters long. Consist of the same character set used for host names, in accordance with RFC 1123: Hyphens (-), and single-byte alphanumeric characters (a to z, A to Z, and 0 to 9). If you use third-party vendor clusterware, then Oracle recommends that you use the vendor cluster name. • Grid Naming Service Virtual IP Address (GNS VIP): If you plan to use GNS, then configure a GNS name and fixed address on the DNS for the GNS VIP, and configure a subdomain on your DNS delegated to the GNS VIP for resolution of cluster addresses. GNS domain delegation is mandatory with dynamic public networks (DHCP, autoconfiguration). • Single Client Access Name (SCAN) and addresses Using Grid Naming Service Resolution: Do not configure SCAN names and addresses in your DNS. SCANS are managed by GNS.我这次用的这个 Using Manual Configuration and DNS resolution: Configure a SCAN name to resolve to three addresses on the domain name service (DNS).这个东西跟 11.2 的应该是一致的
	<p>Standard or Hub Node Public, Private and Virtual IP names and Addresses: If you are not using GNS, and you are configuring a Standard cluster, then configure the following for each Hub Node:</p> <ul style="list-style-type: none"> • Public node name and address, configured on the DNS and in /etc/hosts (for example, node1.example.com, address 192.0.2.10). The public node name should be the primary host name of each node, which is the name displayed by the <code>hostname</code> command. • Private node address, configured on the private interface for each node. The private subnet that the private interfaces use must connect all the nodes you intend to have as cluster members. Oracle recommends that the network you select for the private network uses an address range defined as private by RFC 1918. • Public node virtual IP name and address (for example, <code>node1-vip.example.com</code>, address 192.0.2.11). If you are not using GNS, then determine a virtual host name for each node. A virtual host name is a public node name that is used to reroute client requests sent to the node if the node is down. Oracle Database uses VIPs for client-to-database connections, so the VIP address must be publicly accessible. Oracle recommends that you provide a name in the format <code>hostname-vip</code>. For example: <code>myclstr2-vip</code>.

配置 DHCP DNS:

```
[root@lunar1 ~]# rpm -qa dhcp
dhcp-3.0.5-31.el5
[root@lunar1 ~]#
[root@lunar1 ~]# yum install bind
Loaded plugins: rhnplugin, security
This system is not registered with ULN.
ULN support will be disabled.
Setting up Install Process
Package 30:bind-9.3.6-20.P1.el5.x86_64 already installed and latest version
Nothing to do
[root@lunar1 ~]#
[root@lunar1 ~]# yum install caching-nameserver
Loaded plugins: rhnplugin, security
This system is not registered with ULN.
ULN support will be disabled.
Setting up Install Process
Resolving Dependencies

30·9 3 6=20 P1 e15

Complete!

[root@lunar1 ~]#

配置 /var/named/chroot/etc/named.conf:

```
dump-file          "/var/named/data/cache_dump.db";
statistics-file   "/var/named/data/named_stats.txt";
memstatistics-file "/var/named/data/named_mem_stats.txt";

// Those options should be used carefully because they disable port
// randomization
// query-source      port 53;
// query-source-v6   port 53;

allow-query        { any; };
allow-query-cache { any; };
allow-transfer    {"none";};           // Slave serves that can pull zone transfer. Ban
everyone by default
};

logging {
    channel default_debug {
        file "data/named.run";
        severity dynamic;
    };
};

view localhost_resolver {
    match-clients      { any; };
    match-destinations { any; };
    recursion yes;
    include "/etc/named.zones";
};

[root@lunar1 etc]#
```

```
[root@lunar1 etc]# cat named.zones
zone "flex.com" IN {
    type master;
    file "flex.com.zone";
    allow-update { none; };
};

zone "69.168.192.in-addr.arpa" IN {
    type master;
    file "69.168.192.local";
    allow-update { none; };
};

[root@lunar1 etc]#
```

=====

=====

配置正反向解析：

=====

=====

```
[root@lunar1 etc]# cd /var/named/chroot/var/named
[root@lunar1 named]# ll named.zero
-rw-r---- 1 root named 427 Dec 20 2011 named.zero
[root@lunar1 named]# ll named.local
-rw-r---- 1 root named 426 Dec 20 2011 named.local
[root@lunar1 named]# cp -p named.zero flex.com.zone
[root@lunar1 named]# cp -p named.local 69.168.192.local
[root@lunar1 named]#
```

编辑 flex.com.zone：

```
[root@lunar1 ~]# cd /var/named/chroot/var/named
[root@lunar1 named]# cat flex.com.zone
$TTL      86400
$ORIGIN flex.com.

@           IN SOA    dns.flex.com.      root.flex.com.  (
                           42
                           ; serial (d. adams)
                           3H
                           ; refresh
                           15M
                           ; retry
                           1W
                           ; expiry
                           1D )
                           ; minimum
                           IN        NS      dns.flex.com.
dns       IN        A       192.168.69.101
gns       IN        A       192.168.69.102
grid      IN        NS     gns
$ORIGIN host.flex.com.

@           IN        NS      gns.flex.com.
[root@lunar1 named]#
```

编辑 69.168.192.local：

```
[root@lunar1 named]# cat 69.168.192.local
$TTL      86400
```

```
@           IN      SOA      dns.flex.com. root.flex.com.  (
                                         1997022700 ;

[root@lunar1 named]#
```

启动 DNS 服务:

```
[root@lunar1 named]# service named restart
Stopping named: [  OK   ]
Starting named: [  OK   ]
[root@lunar1 named]# chkconfig named on
[root@lunar1 named]# [root@lunar1 named]# chkconfig --list named
named           0:off    1:off    2:on     3:on     4:on     5:on     6:
off
[root@lunar1 named]#
```

编辑所有 RAC 节点的 /etc/resolv.conf 文件 (DNS client)

我这里使用 lunar1 作为 DNS GNS RAC 的第一个节点，都在这里了，o(∩_∩)o 哈哈：

```
[root@lunar1 named]# cat /etc/resolv.conf

# 13714588 add timeout, rotate, attempts to mitigate issues with poor or misconfigured single
DNS server
# timeout:n Initial timeout for a query to a nameserver. The default value is five seconds. The
maximum value is 30 seconds.
# For the second and successive rounds of queries, the resolver doubles the initial timeout and
is divided by the number
# of nameservers in the resolv.conf file.
option timeout:4
# attempts:n How many queries the resolver should send to each nameserver in the resolv.conf file
before it stops execution.
# The default value is 2. The maximum value is 5.
option attempts:2
```

```
# rotate Enables the resolver to use all the nameservers in the resolv.conf file, not just the
first one.

option rotate

# Search domain and name server
search flex.com

# Commented it out, because OUI complains about it
#domain flex.com

nameserver 192.168.69.101

[root@lunar1 named]#
```

验证 dns 工作是否正常（两个节点都做一下）：

检验正向解析：

```
[root@lunar1 named]# dig gns.flex.com

; <>> DiG 9.3.6-P1-RedHat-9.3.6-20.P1.el5 <>> gns.flex.com
;; global options:  printcmd
